

Take advantage of tankless technology

Never take another cold shower again! Rinnai tankless water heaters heat water on demand, so you're never limited to a fixed pre-heated supply as with a tank. You'll enjoy hot water when you want it, for as long as you need it. Take a shower, wash dishes and do laundry all at the same time!

Energy Costs

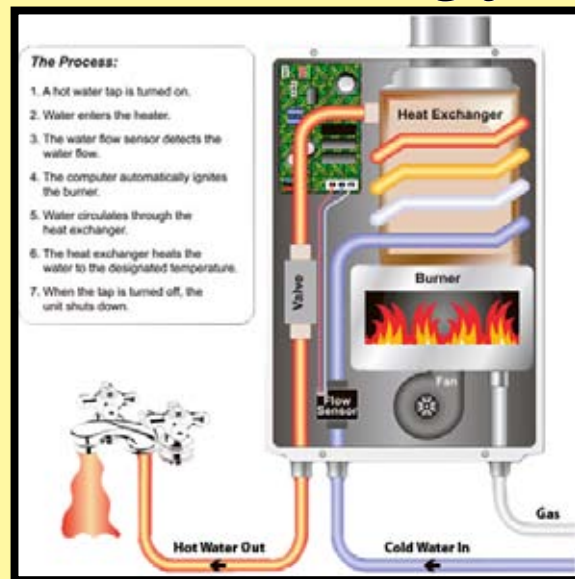

With Rinnai tankless water heaters, you'll enjoy up to 40% energy savings. That's because the units are designed to be highly efficient and only heat water when it's needed. When the demand for water ceases, the unit shuts down and uses no energy, a revolutionary advantage over inefficient tank-style heaters.

Performance and Longevity

With a Rinnai tankless water heater, you get the durability and reliability of a commercial-grade copper heat exchanger and an industry-leading 12-year limited warranty on the heat exchanger. Plus, Rinnai tankless water heaters have a typical life span of 20 years or more installed in residential applications, up to twice as long as a tank.

Space Savings and Flexible Installation Options

Reclaim precious space in your home. Traditional tank water heaters can take up to 16 square

feet of valuable floor space. However, Rinnai tankless units—about the size of a carry-on suitcase—can be installed on virtually any wall inside or outside of your home.

More Capacity

Meeting increased hot water demands can be a challenge for traditional tank-style heaters, however, with Rinnai's innovative technology you'll never run out of hot water. The units can be used individually, in pairs or in banks of three or more for residential, commercial and multi-family applications.

Peace of Mind

With Rinnai tankless water heaters, there's no tank to leak or break, thus reducing the risk of flooding. Rinnai offers a line of controllers that make it easy to set temperatures precisely to ensure comfort and prevent scalding.

How does a Tankless Water Heater Work?

A Tankless water heater uses heating elements to warm the passage of water rather than storing a limited supply of warmed water like a traditional hot water heater.

Traditional hot water heaters are built to keep a supply of hot water at your disposal at all times. This means that your water heater continuously uses energy to warm water whether or not you need it.

A Tankless water heater, however, heats the water only when you ask for it. With these smaller on demand devices, you start the warming process when you initiate the flow of water. Cool water passes through a heating element and warms to a desired temperature before continuing on to the hot water lines.

Rather than constantly warming the water, you begin heating the water when you turn on a hot faucet or an appliance.

What are the advantages of a tankless hot water heater system?

Also known as a point of use water heater or on demand, this innovative product generates hot water immediately when you open the hot water faucet. The unit then turns itself off when the faucet is closed, thus saving energy costs. The energy consumed is only for heating the water that is needed for that specific time. Since there is no storage of hot water and no constant heating and re-heating of water as in standard water heaters, you're not wasting energy when you don't need it.

Flint Hill Gas Logs

The Flint Hill Log Set features richly detailed, hand-painted logs mounted atop our new vent-free Contour Burner. This complete set includes glowing embers to add to the illusion of a real wood fire at any heat setting. This competitively priced log/burner combo requires a minimum firebox depth of just 12 inches, making Flint Hill the ideal log set for existing fireplaces and fireboxes.
